Final Deliverable – Software Project

Final assessment – 70% of your mark for this module

As part of this assignment your group should submit all of your deliverables (software + version control logs + report.) This is a chance to reflect on the feedback from your midterm assessment and produce a robust report describing both your process and your deliverable components. How you choose to structure your report is up to you, but as a general set of guidelines you might want to include the following headings.

Background

Here you should detail your agenda including your aims, literature and sources of information and the scope of your project. This should set the scene for the work that follows including ideation steps and a brief summary of your group and process.

Planning and Research

This section should focus on evidencing the research that you have undertaken in order to substantiate the project. This could include a literature review, some visual evidence of milestones and process (e.g. Gantt charts) and any evidence of planning and iteration. It should be clear to the reader how and why you have settled on certain approaches for your project and how resources and time are allocated in relation to the functionality of your system. There should be a detailed breakdown of your plan in terms of a working process and set of expectations for deliverables (e.g. dates, times, functionality etc.)

Prototyping and Iteration

Should show evidence of iteration from low, to medium to high fidelity prototyping. There should be a clear rhetoric, justification for design decisions and a process of systematic evaluation that results in clear improvements to the system design over time and iteration. Equally, functional prototypes should evidence the development of code over time including testing of input/output. Functionality should be justified through an analytical approach to development e.g. "we added this feature because..."

Design

This section should focus on how you have come about your design specifications through prototyping and evaluation. You should (re)detail the specifications of your system at this point with a clear view about what it is you are building and the

approaches that you intend to take. It should be clear what you are intending to build and how you intend to go about producing such a build in the time frame given.

System Development

There should be a clear and concise description of the development of code, assets and resources that make up the core components of the system. This should include any steps or stages in your development process and testing. You can make reference to your central git repository here, though you might want to include snippets of code and/or processes to better describe how outcomes were achieved. You should also describe the processes that you engaged in e.g. test-driven development, agile techniques and how they enabled the development and iterative, incremental changes that contributed towards the success/failure of your projects.

Analysis

You should produce a comprehensive analysis of your solution(s) relating to a wide range of resources including literature.

Evaluation

You should evaluate your software development as both a set of processes (ie team working, methodologies employed) and the thing that you have built. Higher marks will be awarded where the evaluation is critical in nature, alluding to future work and highlighting areas for potential improvement.

Conclusion/Summary

You should summarise the outcomes of your project and try to place it in a space. Here you might want to discuss where it fits in a dynamic workflow or the impact that it might have on a community of stakeholders or users.

The marking criteria for your final assessed component (70% or 70 marks) of the course is as follows.

Code solves challenges presented in the aims/objectives Iterative design Approach is fit for purpose without drastic oversights 4 Elegance/aesthetics/readability of code Sensible approach to structure (e.g. index.html, style.css, functionality.js) Evidence of collaboration and team work. Individual submissions should show engagement with a wide range of external resources and utilisation of tools such as peer review and discussion. Evidence of milestones and reflective updates (e.g. updated Gantt charts, resource allocation.) 2 Difficulty of technical challenge 4 Novelty of technical challenge 4 Novelty of the system working 2 UI evaluation Well documented tests Effective error handling Systematic testing regime including design of appropriate test cases 1 Justification of testing methods 1 User evaluation involving representative stakeholders formative User evaluation involving representative stakeholders summative 1 Desport Good introduction and fair discussion of literature Clear statement of problem and effective problem analysis Clear structure Justification of design decisions 2 Good argumentation and justification of claims/problem analysis		Total Marks
